

Abstract

5 A bicycle control device having a switch mounting recess
therein is disclosed. The bicycle control device could be a
shifter, a brake control mechanism or an integrated shifting
and brake control device. A control switch of a cycle
computer is mountable in the switch mounting recess. The
control switch is connected to a cycle computer, located
remote from the control switch, by a connecting cable. The
10 control switch can be attached in the switch mounting recess
by various means, including, adhesively connecting the
control switch to the switch mounting recess. In one
embodiment of the invention, the control switch is press
fitted into the switch mounting recess. In another
15 embodiment, an elastic portion of the control switch is
press fitted into a hole in the switch mounting recess. The
control switch can also be securely retained in the switch
mounting recess by a retention ring attached to the control
device.
